The paper I'm trying to implement is "The application of physics-informed neural networks (PINNS) for geothermal well recovery post-injection" Mesias Piere Canilandi et al., which explored the use of PINNS to simulate thermal recovery from geothermal wells following injection test. Real well data from "Estimation of static formation temperature n geothermal well by using an artificial neural network approach" A. Bassam et al., encompassing parameters such as circulation time, injection temperature, heating-up surveys, and wellbore radius measurements, are employed for analysis.

Objective:

1. Implement the paper model
2. Employ hard constrain
